

# **CSC363 Tutorial #6**

**More reductions, Arithmetic Hierarchy**

March 1, 2023

# Things covered in this tutorial

- ★ What is a *m*-reduction?
- ★ What is the *arithmetic hierarchy*?
- ★ Why are we learning all of this?
- ★ Why did I enroll in this course?
- ★ Can I get a hint for A4?

You know why you enrolled in this course.

# Reductions, once again...

Recall: Given two languages  $A$  and  $B$ , we say  $A$  **Turing reduces** to  $B$  ( $A \leq_T B$ ) if given an oracle for  $B$ , you can build a decider for  $A$ .

The HP-oracle.

# Reductions, once again...

**Task:** Let

$$\text{HP} = \{x : M_x(x) \text{ halts}\}.$$

$$\overline{\text{HP}} = \{x : M_x(x) \text{ loops}\}.$$

Prove that  $\overline{\text{HP}} \leq_T \text{HP}$ .

# Reductions, once again...

**Task:** Let

$$\text{HP} = \{x : M_x(x) \text{ halts}\}.$$

$$\overline{\text{HP}} = \{x : M_x(x) \text{ loops}\}.$$

Prove that  $\overline{\text{HP}} \leq_T \text{HP}$ .

**Answer:** Assuming we have a decider `in_HPbar` for  $\overline{\text{HP}}$ , we can build the following decider for HP:

```
in_HP(x):  
  if in_HPbar(x):  
    reject  
  accept
```

# Reductions, once again...

**Task:** Let

$$\text{HP} = \{x : M_x(x) \text{ halts}\}.$$

$$\overline{\text{HP}} = \{x : M_x(x) \text{ loops}\}.$$

Prove that  $\overline{\text{HP}} \leq_T \text{HP}$ .

**Answer:** Assuming we have a decider `in_HPbar` for  $\overline{\text{HP}}$ , we can build the following decider for HP:

```
in_HP(x):  
  if in_HPbar(x):  
    reject  
  accept
```

But  $\overline{\text{HP}}$  is not c.e., yet HP is c.e.. Why is  $\overline{\text{HP}} \leq_T \text{HP}$ ?

*m-reductions* address this issue with Turing reductions.

## *m*-reductions

Also known as *many-one reductions*. We say *A m-reduces to B* ( $A \leq_m B$ ) if there is a computable function  $f : \mathbb{N} \rightarrow \mathbb{N}$  such that:

$$x \in A \Leftrightarrow f(x) \in B.$$

The *m*-reduction is a *stronger* version of the Turing reduction.

## ***m*-reductions**

Scenario: The aliens come back, and see that we have been abusing their HP-oracle to illegally decide unrecognizable languages like  $\overline{\text{HP}}$ .

# m-reductions

Scenario: The aliens come back, and see that we have been abusing their HP-oracle to illegally decide unrecognizable languages like  $\overline{HP}$ .

They confiscate the HP-oracle from humans.

## ***m*-reductions**

However, the aliens are still willing to solve the halting problem for you.

## ***m*-reductions**

However, the aliens are still willing to solve the halting problem for you.

Now say you wanted to decide whether something is in  $A_{\text{TM}}$ . Recall

$$A_{\text{TM}} = \{(x, w) : M_x(e) \text{ accepts}\}.$$

You just have to do the following:

## ***m*-reductions**

However, the aliens are still willing to solve the halting problem for you.

Now say you wanted to decide whether something is in  $A_{\text{TM}}$ . Recall

$$A_{\text{TM}} = \{(x, w) : M_x(e) \text{ accepts}\}.$$

You just have to do the following:

- ★ Given an instance  $(x, w)$  of  $A_{\text{TM}}$ , construct the following Turing machine  $T$ :

$T(z)$ :

```
ignore z
run  $M_x(w)$  # might loop!
if  $M_x(w)$  rejects: loop
else: halt
```

This machine  $T$  has a number; call this machine's number  $f(x, w)$ .

## ***m*-reductions**

However, the aliens are still willing to solve the halting problem for you.

Now say you wanted to decide whether something is in  $A_{\text{TM}}$ . Recall

$$A_{\text{TM}} = \{(x, w) : M_x(e) \text{ accepts}\}.$$

You just have to do the following:

- ★ Given an instance  $(x, w)$  of  $A_{\text{TM}}$ , construct the following Turing machine  $T$ :

$T(z)$ :

```
ignore z
run  $M_x(w)$  # might loop!
if  $M_x(w)$  rejects: loop
else: halt
```

This machine  $T$  has a number; call this machine's number  $f(x, w)$ .

- ★ Ask the aliens whether  $f(x, w) \in \text{HP}$ , with a bribe of [REDACTED].

## ***m*-reductions**

We say  $A$  ***m*-reduces to**  $B$  ( $A \leq_m B$ ) if there is a computable function  $f : \mathbb{N} \rightarrow \mathbb{N}$  such that:

$$x \in A \Leftrightarrow f(x) \in B.$$

## *m*-reductions

We say *A m-reduces to B* ( $A \leq_m B$ ) if there is a computable function  $f : \mathbb{N} \rightarrow \mathbb{N}$  such that:

$$x \in A \Leftrightarrow f(x) \in B.$$

*Ok... how is this different from Turing reductions?*

**Answer:** To show  $A \leq_T B$ , you assume that you have a *B*-oracle, and build a decider for *A*.

## *m*-reductions

We say *A m-reduces to B* ( $A \leq_m B$ ) if there is a computable function  $f : \mathbb{N} \rightarrow \mathbb{N}$  such that:

$$x \in A \Leftrightarrow f(x) \in B.$$

*Ok... how is this different from Turing reductions?*

**Answer:** To show  $A \leq_T B$ , you assume that you have a *B*-oracle, and build a decider for *A*.

To show  $A \leq_m B$ , you assume that you have a *B*-oracle, and build a decider for *A*, *with the following restrictions*:

- ★ You must call the *B*-oracle exactly once – no more, no less.
- ★ **You must return whatever the *B*-oracle returns**; negating the return value of the *B*-oracle (or performing any modification to the return value) is illegal.

In other words, the last line of your decider for *A* must be `return in_B(...)`.

## *m*-reductions

**Task:** We've shown  $\overline{HP} \leq_T HP$  using the following decider for  $\overline{HP}$ :

```
in_HPbar(x):  
    if in_HP(x):  
        accept  
    reject
```

Why isn't the above proof acceptable for showing that  $\overline{HP} \leq_m HP$ ?

## *m*-reductions

**Task:** We've shown  $\overline{HP} \leq_T HP$  using the following decider for  $\overline{HP}$ :

```
in_HPbar(x):  
    if in_HP(x):  
        accept  
    reject
```

Why isn't the above proof acceptable for showing that  $\overline{HP} \leq_m HP$ ?

**Answer:** Remember; in a *m*-reduction proof of  $A \leq_m B$ , you must return whatever the *B*-oracle returns. You can't make any modifications (such as negation) to what the *B*-oracle returns.

The last line of your decider for *A* must be `return in_B(...)`.

## *m*-reductions

**Example:** show that  $\{\text{even numbers}\} \leq_m \{\text{odd numbers}\}$ .

## $m$ -reductions

**Example:** show that  $\{\text{even numbers}\} \leq_m \{\text{odd numbers}\}$ .

*Proof.* I want to use the following procedure, using an oracle for the odd numbers:

```
is_even(x):  
    if is_odd(x):  
        reject  
    accept
```

Unfortunately, this is not allowed...

## *m*-reductions

**Example:** show that  $\{\text{even numbers}\} \leq_m \{\text{odd numbers}\}$ .

*Proof.*

```
is_even(x):  
    t = x + 1  
    return is_odd(t)
```

## *m*-reductions

**Example:** show that  $\{\text{even numbers}\} \leq_m \{\text{odd numbers}\}$ .

*Proof.*

```
is_even(x):  
    t = x + 1  
    return is_odd(t)
```

This is acceptable!

## *m*-reductions

We say *A m-reduces to B* ( $A \leq_m B$ ) if there is a computable function  $f : \mathbb{N} \rightarrow \mathbb{N}$  such that:

$$x \in A \Leftrightarrow f(x) \in B.$$

The above function  $f$  is called the *reduction function*.<sup>1</sup>

---

<sup>1</sup>This function does not have to be injective.

# *m*-reductions

We say *A m-reduces to B* ( $A \leq_m B$ ) if there is a computable function  $f : \mathbb{N} \rightarrow \mathbb{N}$  such that:

$$x \in A \Leftrightarrow f(x) \in B.$$

The above function  $f$  is called the *reduction function*.<sup>1</sup>

**Task:** Show that:

- ★  $A \leq_m \{0, 1\}$ , where  $A$  is a computable set.
- ★  $A \not\leq_m \emptyset$ , where  $A$  is any nonempty set.
- ★  $A \leq_m \text{HP} = \{x : M_x(x) \text{ halts}\}$ , where  $A$  is a c.e. set.

---

<sup>1</sup>This function does not have to be injective.

## *m*-reductions

Note that if  $A$  is c.e., then  $A \leq_m \text{HP}$ .

Is the converse true? If  $A$  is any set with  $A \leq_m \text{HP}$ , does it follow that  $A$  is c.e.?

## $m$ -reductions

Note that if  $A$  is c.e., then  $A \leq_m \text{HP}$ .

Is the converse true? If  $A$  is any set with  $A \leq_m \text{HP}$ , does it follow that  $A$  is c.e.?

**Yes.** In fact, if  $A \leq_m B$  and  $B$  is c.e., then so is  $A$ . (Think about how you would recognize membership in  $A$ !)

## $m$ -reductions

Note that if  $A$  is c.e., then  $A \leq_m \text{HP}$ .

Is the converse true? If  $A$  is any set with  $A \leq_m \text{HP}$ , does it follow that  $A$  is c.e.?

**Yes.** In fact, if  $A \leq_m B$  and  $B$  is c.e., then so is  $A$ . (Think about how you would recognize membership in  $A$ !)

Consequently,  $\overline{\text{HP}} \not\leq_m \text{HP}$ .

# Arithmetic Hierarchy

(I included this because the assignment's explanation might not be clear enough)

In assignment 3 questions 1 and 4, you prove that any set  $A$  is c.e. if and only if there is a computable binary relation  $R$  such that

$$A = \{x : \exists y \, R(x, y)\}.$$

# Arithmetic Hierarchy

(I included this because the assignment's explanation might not be clear enough)

In assignment 3 questions 1 and 4, you prove that any set  $A$  is c.e. if and only if there is a computable binary relation  $R$  such that

$$A = \{x : \exists y R(x, y)\}.$$

For example:

- ★ The set of even numbers  $E$  is c.e., since

$$E = \{x : \exists y R(x, y)\}$$

where  $R(x, y)$  is true iff

# Arithmetic Hierarchy

(I included this because the assignment's explanation might not be clear enough)

In assignment 3 questions 1 and 4, you prove that any set  $A$  is c.e. if and only if there is a computable binary relation  $R$  such that

$$A = \{x : \exists y R(x, y)\}.$$

For example:

- ★ The set of even numbers  $E$  is c.e., since

$$E = \{x : \exists y R(x, y)\}$$

where  $R(x, y)$  is true iff  $x$  is even.

- ★ The halting set is computable, since

$$\text{HP} = \{x : \exists s \phi(x, s)\}$$

where  $\phi(x, s)$  is true iff

# Arithmetic Hierarchy

(I included this because the assignment's explanation might not be clear enough)

In assignment 3 questions 1 and 4, you prove that any set  $A$  is c.e. if and only if there is a computable binary relation  $R$  such that

$$A = \{x : \exists y R(x, y)\}.$$

For example:

- ★ The set of even numbers  $E$  is c.e., since

$$E = \{x : \exists y R(x, y)\}$$

where  $R(x, y)$  is true iff  $x$  is even.

- ★ The halting set is computable, since

$$\text{HP} = \{x : \exists s \phi(x, s)\}$$

where  $\phi(x, s)$  is true iff  $M_x(x)$  halts in  $s$  steps or less.

# Arithmetic Hierarchy

What about Tot?

$$\text{Tot} = \{x : M_x \text{ halts on any input}\}$$

# Arithmetic Hierarchy

What about Tot?

$$\text{Tot} = \{x : M_x \text{ halts on any input}\}$$

**Task:** find a computable 3-ary relation  $R$  such that

$$\text{Tot} = \{x : \forall y \exists s R(x, y, s)\}.$$

# Arithmetic Hierarchy

What about Tot?

$$\text{Tot} = \{x : M_x \text{ halts on any input}\}$$

**Task:** find a computable 3-ary relation  $R$  such that

$$\text{Tot} = \{x : \forall y \exists s R(x, y, s)\}.$$

**Answer:**  $R(x, y, s)$  is true iff  $\phi_x(y)$  halts in  $s$  steps or less.

# Arithmetic Hierarchy

$$\text{Tot} = \{x : \forall y \exists s R(x, y, s)\}.$$

So far we have:

# Arithmetic Hierarchy

$$\text{Tot} = \{x : \forall y \exists s R(x, y, s)\}.$$

So far we have:

- ★ Any computable set  $C$  can be written in the form  $C = \{x : R(x)\}$ , where  $R$  is some computable relation.

# Arithmetic Hierarchy

$$\text{Tot} = \{x : \forall y \exists s R(x, y, s)\}.$$

So far we have:

- ★ Any computable set  $C$  can be written in the form  $C = \{x : R(x)\}$ , where  $R$  is some computable relation.
- ★ Any c.e. set  $A$  can be written in the form  $A = \{x : \exists y R(x, y)\}$ .

# Arithmetic Hierarchy

$$\text{Tot} = \{x : \forall y \exists s R(x, y, s)\}.$$

So far we have:

- ★ Any computable set  $C$  can be written in the form  $C = \{x : R(x)\}$ , where  $R$  is some computable relation.
- ★ Any c.e. set  $A$  can be written in the form  $A = \{x : \exists y R(x, y)\}$ .
- ★ Tot can be written in the form  $\{x : \forall y \exists z R(x, y, z)\}$ .

# Arithmetic Hierarchy

$$\text{Tot} = \{x : \forall y \exists s R(x, y, s)\}.$$

So far we have:

- ★ Any computable set  $C$  can be written in the form  $C = \{x : R(x)\}$ , where  $R$  is some computable relation.
- ★ Any c.e. set  $A$  can be written in the form  $A = \{x : \exists y R(x, y)\}$ .
- ★ Tot can be written in the form  $\{x : \forall y \exists z R(x, y, z)\}$ .
- ★ ??? can be written in the form  $\{x : \exists y_1 \forall y_2 \exists y_3 R(x, y_1, y_2, y_3)\}$ .

# Arithmetic Hierarchy

$$\text{Tot} = \{x : \forall y \exists s R(x, y, s)\}.$$

So far we have:

- ★ Any computable set  $C$  can be written in the form  $C = \{x : R(x)\}$ , where  $R$  is some computable relation.
- ★ Any c.e. set  $A$  can be written in the form  $A = \{x : \exists y R(x, y)\}$ .
- ★ Tot can be written in the form  $\{x : \forall y \exists z R(x, y, z)\}$ .
- ★ Cof can be written in the form  $\{x : \exists y_1 \forall y_2 \exists y_3 R(x, y_1, y_2, y_3)\}$ .

Cof =  $\{x : \text{There are finitely many inputs } y \text{ for which } M_x(y) \text{ loops}\}$ .

This alternating syntactical combination is known as the *Arithmetic Hierarchy* or the  $\Sigma_n^0$ - $\Pi_n^0$  *Hierarchy*.
